

Hero Video Upload Fix — Manager Summary

Jays Shop Tech Team

July 27, 2026

Problem

Managers uploading MP4 hero videos in `/admin/hero-media` received “**Upload failed**” or “**Failed to fetch**” errors.

Root Cause

Vercel serverless functions reject request bodies larger than approximately **4.5 MB**. Hero videos exceeded this limit, so the upload never reached our application code.

What We Changed

1. Direct browser-to-Cloudflare R2 uploads

- The browser uploads the video file straight to our Cloudflare R2 bucket using a temporary signed URL.
- This bypasses Vercel’s body-size limit entirely.

2. New presigned-URL API

- Route: `/api/admin/hero-slides/presigned-url`
- Validates the video file, then returns a signed upload URL and final public URL.

3. Updated slide-creation API

- Route: `/api/admin/hero-slides` (POST)
- Now accepts a lightweight JSON record after the file is already in R2, creating the database slide entry.

4. Updated admin page

- `/admin/hero-media` now uses the direct-upload flow for MP4/WebM videos.
- Image uploads continue to work exactly as before.

5. R2 bucket CORS policy

- Configured Cloudflare to allow upload requests from the production Vercel domain.

Result

- Hero video uploads now work reliably in production.
- No new Vercel Blob charges; Cloudflare R2’s free tier covers storage.
- Images and existing slides are unaffected.

Status

Deployed and verified. Managers can upload hero videos from the production admin dashboard.
